1 Introduction

This is a place to keep track of all the statements I already have. I will document what still needs to be done, what I am stuck on and why and what I have questions about.

Todo list

- Lemma *aux1*

```
lemma aux1 (l : ℕ) {X : Type*} {s : ℕ → Type*} (Y : (m : ℕ) → s m → Set X):
    ⋃ m, ⋃ (_ : m < Nat.succ l), ⋃ j, Y m j =
    (⋃ (j : s l), Y l j) ∪ ⋃ m, ⋃ (_ : m < l), ⋃ j, Y m j
```

- Lemma *ENat.coe_lt_top*

```
lemma ENat.coe_lt_top {n : ℕ} : ↑n < (⊤ : ℕ∞)
```

Does this already exist and if no is this good?

Do the proofs.

- Definition *kification*

```
def kification {X : Type*} [t : TopologicalSpace X] : TopologicalSpace X where
IsOpen A := ∀ (B : t.Compacts), t.IsOpen (A ∩ B)
isOpen_univ := sorry
isOpen_inter := sorry

Is this definition good? Should this be a structure?

How can I change the Set below to the type of subtypes?

How I do the typecasting correctly in mapsto (see code)?

- Definition *CWComplex_subcomplex*

Make this work and do the proofs!

How do I tell lean to choose the inferred instance over the synthesized instance?

Floris said to redefine the product first.

- Definition *CWComplex_product*
